

Product description

IP-Restriction allows only users from certain IP-Addresses to enter the shop.

The main reason to use IP-Restriction is a big End customer with high security needs (e.g. Bank) requests the IP-Restriction.

IP-Restrictions are difficult to handle the IP-Address of the end customer (Bank) may change periodically. This always stops orders in the shop until the new IP-Addresses are entered in the not-restricted list.

If a RSM does not have a fixed IP-Address from his Internet Provider – access to the shop-administration may be lost very often. This does not interrupt ordering but may cause problems for an "utypia order integration".

Therefore we recommend IP-Restriction to be implemented only on request of an important end customer.

How does it work

This add-on block access for all users – if they do not use an IP-adress that was specifically allowed

Target group

- main reasons for the use of this add-on are:
 - End customers with high security demands (banks)
 - But which do not have an uTypia e-procurement integration

Advantages and disadvantages

Advantages:

- better security

Disadvantages:

- if IP-adress-changes no orders nor administration are possible

Included Services:

Trodat Internet Services will add and remove IP-Addresses to the "not-restricted list"

The price is per Shop – not per uTypia Licensee – meaning the IP Restriction is activated only for one shop

Not included services:
